The present invention relates to the isolation of Mycobacterium tuberculosis antigen polypeptides (e.g. Tb24) and the nucleic acids encoding them. The invention describes compounds and methods for the diagnosis of tuberculosis or for inducing protective immunity against tuberculosis. The compounds comprise at least one immunogenic portion of one or more Mycobacterium proteins and nucleic acid molecules encoding such polypeptides. The Mycobacterium proteins and nucleic acid molecules of Mycobacterium infection in patients and biological samples. The compounds of the invention and antibodies directed against the Mycobacterium infections and nucleic acid molecules may be used in vaccines for immunisation against Mycobacterium infections. The nucleic acids encoding the Mycobacterium proteins may be used in vaccines for immunisation against Mycobacterium polypeptide for MO-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            An isolated polypeptide comprising a Mycobacterium antigen, e.g., from Mycobacterium tuberculosis, useful in a vaccine for enhancing an immune response to and inhibiting development of a Mycobacterium infection

                                                                                                                                                                                                                                                                                                              consisting of a His tag for purification, antigen MtB81 and antigen Mo2. Compositions comprising at least 2 heterologous antigens, as a fusion protein, and vectors expressing the fusion proteins are used as vaccines to prophylactically immunise mammals (especially humans) against infection by Mycobacteria. The compositions contain at least 2 heterologous antigens that increase the serological sensitivity of individuals infected with tuberculosis, a disease frequently affecting patients with acquired immunodeficiency disease, AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a modified aspartokinase from Corynebacterium glutamicum (e.g., AAB29607) and to DNA encoding the modified aspartokinase of the invention is sapartokinase of the invention is modified to remove its sensitivity to feedback inhibition by L-threonine or L-lyaine. This is achieved by substituting the wild-type Thr 311 with any other amino acid; for example, in AAB29607 Thr 311 is substituted by III. The invention also relates to expression vectors and host coryneform bacteria containing the modified DNA, and to the preparation of L-lysine using coryneform bacteria transformed with the modified aspartokinase DNA of the invention provides efficient production of L-lysine. The present sequence represents a modified corynebacterium glutamicum aspartokinase of the invention, 73111.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DGTTDIIFTCPRSDGRRAMEILKKLOVOG-----NW------TNVLYDDQVGKVSLV 350
                                         The specification describes Coryneform bacteria which produce chemical compounds, which instead of a single copy of an open reading frame (ORF), gene or allale naturally present at a desired locus have at least two copies of the ORF, gene or allele, preferably in tandem arrangement. The modified bacteria are is useful for producing chemical compounds including L-amino acids, vitamins, nucleosides and nucleotides. The present sequence is encoded by a lysC gene, and represents an aspartate kinase carrying the T3111 mutation. Tandem duplications of the lysC gene are used to construct the bacteria of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 09

                                                                                                                                                                                                                          The specification describes Coryneform bacteria which produce chemical compounds, which instead of a single copy of an open reading frame (ORF), gene or allele naturally present at a desired locus have at least two copies of the ORF, gene or allele, preferably in tandem arrangement. The modified bacteria are is useful for producing chemical compounds including L-amino acids, vitamins, nucleosides and nucleotides. The present sequence is encoded by a wild type lysC gene, and represents aspartate kinase. Tandem duplications of the lysC gene are used to construct the bacteria of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chemical;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           64
                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to the isolation of novel Corynebacterium glutamicum genes (AAS96013.) AAS9612) encoding metabolic pathway (MP) proteins. The metabolic pathway proteins of the invention include enzymes involved in the lyaine and methionine biosynthetic pathways. The polynucleotide sequences of the invention of expression of for the large-scale production and/or andulation of expression of fine chemicals such as lysine and methionine. The sequences of the invention may be used to identify C glutamicum and related organisms e.g. C diphtheriae in a subject to detect diphtheria.

AAU71863-AAU71822 represent the novel C glutamicum metabolic pathway proteins of the invention.
                                                                                                                                                                                                              Kim J;

                                                                                                          g
                                                                                                                                  ò
                                                                                                                                                                                                                                      The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium coryneform bacterium of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, in the examplification of the invention.

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a mutant version of the C. glutamicum asparto-kinase (AK) alpha submit. The mutation is at position 279 and is a corresponds to the substitution of a non-acidic amino acid, pref. Ala. This mutation causes removal of the enzyme from additional feedback inhibition. Inhibition by Thr is removed completely and the synergic inhibition of Lys and Thr is also removed. The new AK has increased heat stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ELDMLLTAGERISNALVAMAIESLGAHARSFTGSQAGVITTGTHGNAKIIDVTPGRLQTA

The mutation is at position 279 and corresponds to the substitution of a non-acidic amino acid, pref. Ala. This mutation causes removal of the enzyme from additional feedback inhibition. Inhibition by Thr is removed completely and the symercic inhibition of Lys and Thr is also removed. The new AK has increased heat stability.

The present invention describes a recombinant DNA autonomously replicable in cells of coryneform bacteria (CB), comprising a DNA sequence coding for an aspartokinase (AX) in which feedback inhibition by L-lysine and L-threonine is desensitised, a DNA sequence coding for a dinydrodipicolinate synthase (DHPR), a DNA sequence coding for dinydropicolinate synthase (DHPR), a DNA sequence coding for aspartate decarboxylase (DAMD) and a DNA sequence coding for aspartate aminotransferase (AAT). The present sequence coding for lysC from Brevibacterium lactofermentum. The DNA and related products from the present invention, can be used for improving L-lysine productivity by CB. The L-lysine produced can be used as a fodder
                                                                                                                                                                                                                                                             Recombinant DNA autonomously replicable in coryneform bacteria used to produce L-lysine, codes for e.g. aspartokinase, di:hydropicolinate reductase and synthase and di:amino-pimelate
                                                                                                                                                                                                                                                                                                                                                                 Claim 2; Page 22-23; 59pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     64
                                                                        This is the wild-type alpha subunit of Brevibacerium lactofermentum CATCC 13689 (Corpubacterium glutamicum) aspartokinase, an enzyme involved in the biosynthesis of L-lysine, but which is subject to feedback inhibition. A claimed recombinant DNA molecule that is a utonomously replicable in coryneform bacteria comprises a DNA sequence coding for an aspartokinase in which feedback inhibition by L-lysine and L-threonine is desensitised, and a DNA sequence coding for a diaminopimelate decarboxylase. This mutant aspartokinase preferably has residue Ala-279 of the alpha subunit (see AAW68152) and residue Ala-30 of the beta subunit (see AAW68152) and residue Ala-30 of the beta subunit (see AAW68152) and maino acid that is not Ala and is not an acidic amino acid. The host coryneform bacteria are used in a claimed method for producing L-lysine, which is useful as a fodder additive. They show improvements in L-lysine yield without

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                     US-09-688-672A-4

Sequence 5225, Application US/09134001C
Patent No. 6380370
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS
TITLE OF INVENTION: BIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC.07
CURRENT APPLICATION NUMBER: US/09/134,001C
CURRENT FILING DATE: 1998-08-13
PRIOR APPLICATION NUMBER: US 60/064,964
PRIOR APPLICATION NUMBER: US 60/055,779
PRIOR PELING DATE: 1997-08-14
NUMBER: OF SEQUENCE SEQUENCES SEGT4
